Cibilize — Project Overview (Presentation Summary)

What it is: Cibilize is a personal-finance web application focused on **Indian credit behavior** (similar ideas to CIBIL-style scoring). It helps users explore **credit cards**, estimate **credit health**, track **spending**, run common **money calculators**, and chat with an **AI assistant** about cards and related topics.

Big-picture architecture

The product splits into two main pieces that work together:

1. **Web app (frontend)** — What people see and click: screens, forms, charts, and the chat agent.
2. **Backend API** — Secure server that talks to the database, handles login, stores expenses, serves credit-card data, and runs AI-powered score analysis.

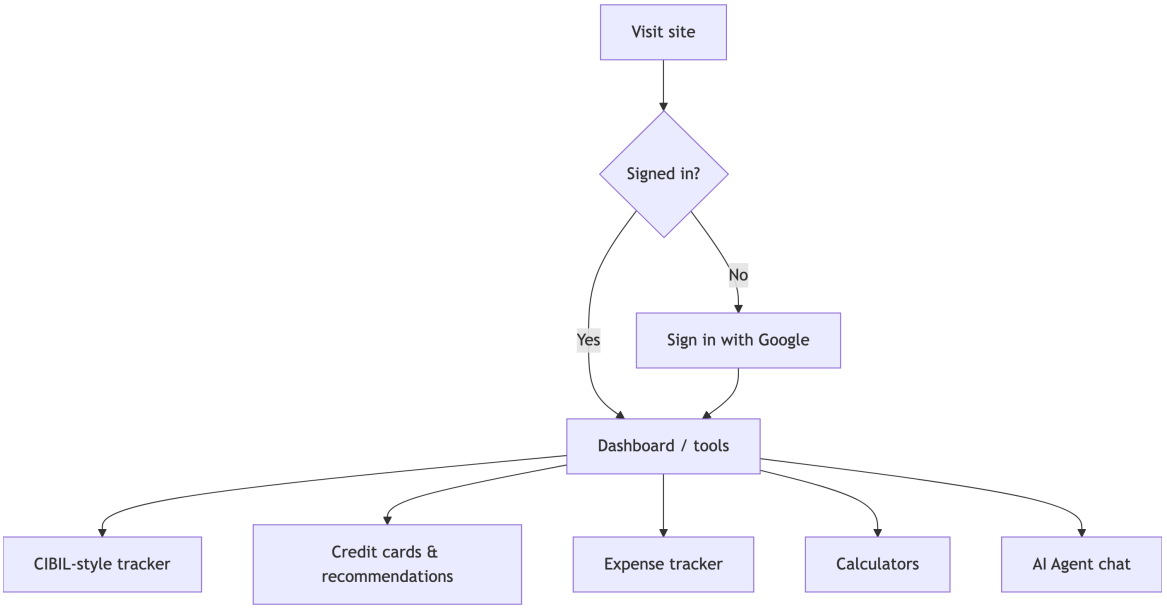

Main technologies (plain English):

Layer	What we use	Role
Frontend	React, TypeScript, Vite	Fast, modern interactive UI
Styling & UI	Tailwind CSS, Radix-based components	Consistent layout and accessibility-friendly controls
Data on the client	TanStack Query	Loads and refreshes server data smoothly

Layer	What we use	Role
Backend	Node.js, Express	Handles routes, security, and business logic
Database	PostgreSQL	Stores users, expenses, credit-card catalog, recommendation history
Sign-in	Google account + secure tokens	Users log in without a separate password for this app
AI	Google Gemini (server), streaming models in the app (e.g. Mistral via AI SDK)	Smart score summaries and conversational help

How a typical session flows

Feature highlights (for presentation)

Credit card recommendations

- Users can browse cards from a **curated catalog** stored in the database.
- **Personalized recommendations** combine user preferences (spending style, income band, desired benefits, fee limits, etc.) with **matching rules** so suggestions fit the profile—not

random picks.

- A separate **AI-enhanced flow** can suggest cards alongside a broader financial snapshot when the user uses the advanced score tool (cards are chosen from a fixed, approved list so outputs stay controlled).

AI Agent

- A **chat-style assistant** users open after signing in.
- It can answer in natural language about **credit cards** and related finance topics, with **streaming replies** (text appears gradually like familiar chatbots).
- It can use **context from the user's recent card recommendation results** (when available) so answers feel relevant instead of generic.

CIBIL score tracker (educational / indicative)

- Users enter simple facts: income, loans, utilization, missed payments, age, etc.
- The system returns an **estimated score band**, **risk view**, **ideas to improve**, **loan eligibility hints**, and **next-step milestones**.
- **Important for presenters:** This is a **decision-support and learning tool**, not an official CIBIL report. Real scores come only from authorized credit bureaus.

Expense tracker

- Add expenses manually and see **lists and summary stats**.
- Optional **file uploads** for receipts or statements; files can be stored via a cloud media service and tied into **processing** workflows on the server side.

Financial calculators (all in one "Calculator" area)

Hands-on tools without needing AI:

- **EMI** — loan installment estimates
- **SIP** — regular investment growth
- **Lumpsum** — one-time investment growth
- **Tax** — tax-oriented estimates
- **Retirement** — long-term savings targets
- **Emergency fund** — how much to keep aside
- **Net worth** — assets minus liabilities picture
- **Credit card payoff** — paying down card debt
- **FD / RD** — fixed/recurring deposit style growth
- **Debt** — overall debt scenarios

Security & quality (short)

- **HTTPS-minded setup**, rate limiting and security headers on the API, input sanitization.
- **Authentication required** for core tools so personal data stays behind login.

Closing line for slides

Cibilize bundles credit education, card discovery, spending visibility, and calculators in one place—and layers AI where it helps explain and recommend, while keeping structured data and rules as the backbone.
